## APPENDIX B. DISCUSSION SUPPLEMENT

TABLE B.1. Type Definitions

	Types		
	Excuse-Seeking	Selfish	Generous
Di Tella et al. ( <i>Able</i> = 8 Allocators)	Believe partner corrupt Take over 5 tokens	Believe partner <i>not</i> corrupt Take any tokens	Neither Excuse-Seeking nor Selfish
Exley (95% List)	Uncensored participants Charity w. Tradeoff < Self Charity == Self, No Tradeoff	Censored Participants	Neither Excuse-Seeking nor Selfish
Dana et al.	<i>Baseline</i> : (5,5) <i>HI</i> : Do Not Reveal	<i>Baseline</i> : (6,1) <i>HI</i> : (6, <i>x</i> )	<i>Baseline</i> : (5,5) <i>HI</i> : Reveal

*Note*: Notes: Information environment definitions follow Exley (2015).

For Exley decisions, Charity == Self was defined as switching within 5 percentage points of each other in the original or 4 rows in the replication.

Generous definitions are: DiTella et al. – believe partner is corrupt and take under 5 tokens or believe partner is not corrupt and don't take any tokens. Exley – Uncensored participants who either don't undervalue the charity-lottery with a tradeoff or have differing charity-self risk preferences.

TABLE B.2. Exley Regression Table, Heterogeneous Effects

	Exley				Replication

Observations	1596	1596	1596	1596	896	896	896	896

\*  $p < 0.10$ , \*\*  $p < 0.05$ , \*\*\*  $p < 0.01$ . Standard errors in parentheses clustered at participant level. Censored participants are excluded. Dependent variables are lottery valuations,  $Y$ . Valuations in self-dollars are scaled as percentages of \$10, and valuations in charity-dollars are scaled as percentages of  $X$ . The results are from the main regression modified to include the shown interactions.  $(X - \bar{X})$  is a participant's  $X$  minus the average  $X$ . Selfish is an indicator for choosing A in the revealed-unaligned state. Wiggler is an indicator for choosing B in the revealed-unaligned state but A in the choice-to-reveal question after choosing not to reveal the state.

## APPENDIX C. COMPACT VERSION OF DI TELLA ET AL.

Participants in the Exley replication complete a task designed to mimic Allocator decisions in DiTella et al. Participants are randomly matched and given an extra \$1. They have three options: (i) *Keep* their dollar (and not affect their partner’s payoff); (ii) *Pass* to charity (potentially providing a \$4 donation); or (iii) attempt to *Take* their partner’s donation. Payoffs are presented in Table C.1. Participants report beliefs over their partner’s actions and the session-level prevalence of *Take*.<sup>1</sup>

TABLE C.1. Payoffs

	Keep	Pass	Take
Keep	1 personal, 1 personal	1 personal, 4 donation	1 personal, 0
Pass	4 donation, 1 personal	4 donation, 4 donation	0, 4 personal
Take	0, 1 personal	4 personal, 0	0, 0

*Note:* *Personal* denotes a payoff for the participant and *donation* denotes money donated to the Children’s Hospital on their behalf. 0 denotes no personal payment or donation.

Choosing *Take* is comparable the corrupt option in Di Tella et al.. Participants can justify *Keep* by believing their partner choose *Take*, much as Allocators can justify taking more tokens by distorting beliefs about their partner’s corruption. However, as shown in Table C.2, we do not find evidence of this belief distortion. Instead, participants who chose *Keep* ascribe consistency between their behavior and that of their partner. Participants selecting *Pass* also ascribe this consistency, but most who try to *Take* believe their partner will *Pass*.<sup>2</sup>

TABLE C.2. Partner Beliefs and Actions

	Believe Keep	Believe Take	Believe Pass
Decide Keep	11	4	2
Decide Take	1	8	11
Decide Pass	0	2	22

*Note:* Rows are a participant’s choice, columns are participant beliefs over their partner’s choice.

<sup>1</sup>Half are paid for the game and a quarter for each for their partner-level and session-level beliefs. Sessions with odd numbers of participants paid one additional participant for session-level beliefs.

<sup>2</sup>Surprisingly, nearly half of those selecting *Take* do not believe their partner chose *Pass*. Participants may have a distribution of beliefs over their partner’s actions, and treat picking *Take* as a lottery paying \$4 with probability  $p$ , the likelihood their partner picks *Pass*. If  $p \in [.25, .50]$  and  $q$  (the probability their partner picks *Take*)  $> p$ , a risk-averse agent who does not care about the charity may *Take* and indicate their partner also did so.

## SCREENSHOTS FROM THE EXLEY REPLICATION

Participant Number: 3384

### Welcome and thank you for participating in this experiment.

You will remain anonymous in the experiment. Your decisions will be identified using an ID number which is not linked to your name. Any research data collected during the course of the study will only identify your decisions by that number.

Your participation in this study is voluntary. Should you change your mind about participating, you can withdraw from the study at any time. Should you choose to withdraw, the data associated with your record will be marked as incomplete, and removed from the retained data after the session. If you withdraw during the experiment, you are entitled to a \$6 show-up fee, but only participants who complete the study will receive additional earnings.

Please raise your hand if you have any questions regarding your participation in this study.

Please press the continue button below if you understand and agree to participate in this study.

I AGREE

Participant Number: 3384

Please listen carefully while the experimenter reads the instructions.

Once the experimenter has finished the instructions, you will be provided with a three digit code.

Please type the three digit code in to the box to continue.

Submit

Participant Number: 3384

You will now be presented with an example decision list and will be asked comprehension questions about it.

If you incorrectly answer any of the comprehension questions, you will be re-directed to answer that question again. After you correctly answer all comprehension questions, you will proceed to make your decisions in this study.

Please press the button below whenever you are ready.

Continue

Participant Number: 3384

### Example Decision List

In this example list:

- **Option A** is always that **you receive \$10**.

- **Option B** is that we **donate some dollar amount to the children at Children's Hospital** on your behalf. As you proceed down the list, the amount the children receive for the playrooms will increase from \$0 to \$10.

**Your task** is to decide the smallest amount that we would have to donate to the children at Children's Hospital on your behalf to give up your \$10. In other words, you will indicate the point at which you would be willing to give up option A for option B.

Option A	Option B
You get \$10.00	Children at Children's Hospital get \$0.00
You get \$10.00	Children at Children's Hospital get \$2.00
You get \$10.00	Children at Children's Hospital get \$4.00
You get \$10.00	Children at Children's Hospital get \$6.00
You get \$10.00	Children at Children's Hospital get \$8.00
You get \$10.00	Children at Children's Hospital get \$10.00

Continue

Participant Number: 3384

### Comprehension Questions

The following displays how a participant could indicate the point at which she would be willing to give up option A for option B. Her preferred option in each row of the decision list is highlighted in green.

Option A	Option B
You get \$10.00	Children at Children's Hospital get \$0.00
You get \$10.00	Children at Children's Hospital get \$2.00
You get \$10.00	Children at Children's Hospital get \$4.00
You get \$10.00	Children at Children's Hospital get \$6.00
You get \$10.00	Children at Children's Hospital get \$8.00
You get \$10.00	Children at Children's Hospital get \$10.00

#### Question 1

If the second row was selected as the decision that counts for payment, then:

The participant would receive nothing, and the children would receive \$2
The participant would receive \$10, and the children would receive nothing
The participant would receive \$10, and the children would receive \$2

Participant Number: 3384

### Comprehension Questions

The following displays how a participant could indicate the point at which she would be willing to give up option A for option B. Her preferred option in each row of the decision list is highlighted in green.

Option A	Option B
You get \$10.00	Children at Children's Hospital get \$0.00
You get \$10.00	Children at Children's Hospital get \$2.00
You get \$10.00	Children at Children's Hospital get \$4.00
You get \$10.00	Children at Children's Hospital get \$6.00
You get \$10.00	Children at Children's Hospital get \$8.00
You get \$10.00	Children at Children's Hospital get \$10.00

#### Question 2

If the sixth row was selected as the decision that counts for payment, then:

The participant would receive nothing, and the children would receive \$10
The participant would receive \$10, and the children would receive nothing
The participant would receive \$10, and the children would receive \$10

Participant Number: 3384

### Main Task

You will now be asked to complete 5 blocks of decision lists. Note that one row of one of these decision lists will be randomly and fairly selected to be implemented for payment.

Please read the instructions carefully at the beginning of each block before making your decisions. You can access the calculator by clicking on the calculator at the top of your screen.

If you have any questions, please raise your hand and someone will come to your seat to answer them. Please press the button below whenever you are ready to begin.

Continue

Participant Number: 3384

### Main Task

On the next page, you will complete 1 decision list. In this list, option A will be fixed and option B will vary as follows:

- Option A is always that you receive \$10.

- Option B is that we donate some dollar amount to the children at Children's Hospital on your behalf. As you proceed down the list, the amount the children receive for the playrooms will increase from \$0 to \$30.

**Your task:** Please decide the smallest amount that we would have to donate to the children at Children's Hospital for you to give up your \$10. In other words, please indicate the point at which you would be willing to give up option A for option B.

Note that your preferred option in each row of the decision list will be highlighted in green.

Continue

Participant Number: 3384

### Main Task

**Your task:** Please indicate the point at which you would be willing to give up option A for option B.  
Contributions made today will go toward sustaining the 13 playrooms available to children at Children's Hospital.

Option A	Option B
You get \$10.00	Children at Children's Hospital get \$0.00
You get \$10.00	Children at Children's Hospital get \$1.50
You get \$10.00	Children at Children's Hospital get \$3.00
You get \$10.00	Children at Children's Hospital get \$4.50
You get \$10.00	Children at Children's Hospital get \$6.00
You get \$10.00	Children at Children's Hospital get \$7.50
You get \$10.00	Children at Children's Hospital get \$9.00
You get \$10.00	Children at Children's Hospital get \$10.50
You get \$10.00	Children at Children's Hospital get \$12.00
You get \$10.00	Children at Children's Hospital get \$13.50
You get \$10.00	Children at Children's Hospital get \$15.00
You get \$10.00	Children at Children's Hospital get \$16.50
You get \$10.00	Children at Children's Hospital get \$18.00
You get \$10.00	Children at Children's Hospital get \$19.50
You get \$10.00	Children at Children's Hospital get \$21.00
You get \$10.00	Children at Children's Hospital get \$22.50
You get \$10.00	Children at Children's Hospital get \$24.00
You get \$10.00	Children at Children's Hospital get \$25.50
You get \$10.00	Children at Children's Hospital get \$27.00
You get \$10.00	Children at Children's Hospital get \$28.50
You get \$10.00	Children at Children's Hospital get \$30.00

OK

Participant Number: 3384

### Main Task

Next, you will complete **4 decision lists**. In these lists, option A is fixed and option B varies as follows:

- **Option A** is always that you receive \$10 with some probability and \$0 otherwise.

- **Option B** is that you receive some dollar amount. As you proceed down the list, the amount you receive will increase from \$0 to \$10.

**Your task:** Please decide the smallest amount that you would accept to give up your chance to receive \$10 with some probability. In other words, please indicate the point at which you would be willing to give up option A for option B.

Note that your preferred option in each row of the decision list will be highlighted in green.

Continue

## Example of Self-risk/Self-certain price list:

**Participant Number: 3384**

**Main Task**

Your task: Please indicate the point at which you would be willing to give up option A for option B.

Option A	Option B
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$0.00
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$0.50
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$1.00
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$1.50
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$2.00
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$2.50
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$3.00
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$3.50
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$4.00
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$4.50
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$5.00
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$5.50
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$6.00
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$6.50
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$7.00
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$7.50
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$8.00
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$8.50
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$9.00
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$9.50
You get \$10.00 with 75% probability, and \$0 otherwise	You get \$10.00

OK

**Participant Number: 3384**

**Main Task**

Next, you will complete 4 decision lists. In these lists, option A is fixed and option B varies as follows:

- **Option A** is always that we donate \$24.00 to the children at Children's Hospital with some probability, and \$0 otherwise, on your behalf.
- **Option B** is that you receive some dollar amount. As you proceed down the list, the amount you receive will increase from \$0 to \$10.

**Your task:** Please decide the smallest amount that you would accept to give up your chance to donate \$24.00 to the children at Children's Hospital with some probability. In other words, please indicate the point at which you would be willing to give up option A for option B.

Note that your preferred option in each row of the decision list will be highlighted in green.

### Bonus Round

You have reached the end of the main task.

You will now complete two Bonus Rounds.

Please read the instructions carefully. If you have any questions at any point, please raise your hand and one of us will come to your seat to answer your questions.

Please press 'Continue' to proceed to Bonus Round 1.

Continue

Participant Number: 3384

### Bonus Round 1

In this round, you will have another opportunity to donate to the children at the Children's Hospital. You will be randomly paired with another participant in this session. Your earnings and donations will depend both on your choice and the choice of your partner.

Half of the pairs in today's session will be randomly selected to have their joint Bonus Round 1 decisions implemented for payment.

**Description of Bonus Round 1 Task:** Both you and your partner will be given \$1 in this round. You both will have three possible options: 'Keep' the \$1, 'Pass' it to the charity, or attempt to 'Take'

- If you choose 'Keep,' you will retain your \$1
- If you choose 'Pass' and your partner does not 'Take,' we will donate \$4 to the children at Children's Hospital on your behalf
- If you choose 'Pass' and your partner chooses 'Take,' you lose the \$1 and the \$4 donation is not made
- If you choose to 'Take' you will retain your \$1, and you will take the \$4 donation if your partner chooses 'Pass'

The money donated today will go to fund the playrooms for the children at Children's Hospital.

Please press 'Continue' to proceed.

Continue

### Bonus Round 1: Decision

Both you and your partner have \$1.

You both have three possible options: 'Keep' the \$1, 'Pass' it to the charity, or attempt to 'Take'

**Keep:** Keep the \$1.

**Pass:** Give up the \$1 in an attempt to give \$4 to the children at Children's Hospital

**Take:** Take any donation, or keep the \$1 if there is no donation

Please make your decision:

Keep

Pass

Take

### Bonus Round 1: Question 1

Before proceeding, we would like to ask you two questions. If your pair's Bonus Round 1 decisions are not selected for payment, we will instead select one of the Bonus Round 1 questions and pay you based on the accuracy of your answer.

In Bonus Round 1, your partner had three options:

**Keep:** Keep the \$1.

**Pass:** Give up the \$1 in an attempt to give \$4 to the children at Children's Hospital

**Take:** Take any donation, or keep the \$1 if there is no donation

What option do you think **your partner** selected?

You will receive \$1 if your answer is correct and Question 1 is selected for payment.

Please make your guess:

My Partner Kept

My Partner Passed

My Partner Took

Participant Number: 3384

Bonus Round 1: Question 1

In Bonus Round 1, your partner had three options:

**Keep:** Keep the \$1.

**Pass:** Give up the \$1 in an attempt to give \$4 to the children at Children's Hospital

**Take:** Take any donation, or keep the \$1 if there is no donation

What option do you think **your partner** selected?

You will receive \$1 if your answer is correct and Question 1 is selected for payment.

**You have selected:**

My Partner Kept

Please click below to confirm.

Change

In a few words, please explain why you think your partner selected the option you indicated in the previous question.

CONTINUE

Participant Number: 3384

Bonus Round 1: Question 2

All participants in this session had three options:

**Keep:** Keep the \$1.

**Pass:** Give up the \$1 in an attempt to give \$4 to the children at Children's Hospital

**Take:** Take any donation, or keep the \$1 if there is no donation

Excluding you, there are 14 participants in today's experiment. How many of them do you think selected 'Take' ?

If Question 2 is selected for payment then:

- You will receive \$1 if the difference between your guess and the actual number who selected 'Take' is no greater than 1

- An additional \$4 is donated to the children at Children's Hospital if your guess exactly equals the actual number of who selected 'Take'

Please make your guess

Continue

You have reached the end of Bonus Round 1.

Please press continue to move on to Bonus Round 2.

Continue

Participant Number: 3384

## Bonus Round 2

In this round, you will be asked to choose between two options, **X** and **Y**, which will result in different payoffs. You will make three of these decisions. Some of the payoff resulting from the option you choose will be yours to keep, and some will be donated on your behalf to the children at UPMC Children's Hospital. There are two possible states, **state 1** and **state 2**, and the payoffs associated with each option depend on this state.

In some cases, you will be aware of this state, and will know the amount you will keep and the amount that will be donated on your behalf to the children at UPMC Children's Hospital. In other cases, you will not know the state initially, but you will be given the option of revealing it before making your choice. Payoffs that depend on the state will be denoted by "?" (a question mark) when you do not know the state. There is an equal chance of each state occurring, that it is as if the state is determined by a coin flip.

Press 'Next Page' below to see the remaining instructions.

Next Page

Participant Number: 3384

## Bonus Round 2

**For this round only, two people in this session will be selected at random by the computer to be paid and to have a donation made to the children at UPMC Children's Hospital on their behalf.** Each individual in the session has an equal chance of being selected, regardless of their choices.

If you are randomly selected, the pay you will receive from this round will be from **one** of the decisions you make, with each decision having an equal chance of being chosen. If you are not selected, your decisions in this round will not be implemented for payment. You will be informed on your computer screen at the end of the study if you are randomly selected.

Contributions made to the Children's hospital today will go toward sustaining 13 playrooms for the children.  
Press 'Continue' below to proceed to the first of three decisions.

Continue

### INSTRUCTIONS FROM THE EXLEY REPLICATION

These instructions were handed to each participant at the beginning of the experiment and read aloud by the experimenter.

### Instructions

Welcome and thank you for your participation. This is a study on decision making. Please turn off your cell phones and similar devices and place them in your bag or on the top shelf. Please do not talk to or in any way try to communicate with other participants in the room.

### Payments

In this study, you will receive a \$10 minimum payment. This \$10 is yours to keep. Whatever you earn from the study will be added to this minimum payment.

All payments will be made in private with cash at the end of the study. Additionally, you will have the opportunity to donate to children at UPMC Children's Hospital of Pittsburgh.

### Main Task

There are three tasks in this study: a main task and two bonus rounds. The following instructions explain how you may earn money from the main task. You may earn further payments from the bonus rounds at the end of the study.

In the main task you will be presented with a series of decision lists. Each decision list consists of a series of different rows with two options, option A and option B. For each row, you will have to select your preferred option.

**Your task in each decision list will be to pick the first row where you would switch from option A to option B.** In other words, you should indicate the point at which you would be willing to give up option A for option B. The option you select in each row of the decision list will then be highlighted in green. If you don't want to switch, you can just mark your preferred option green throughout the list.

**Once you have indicated your choices in all decision lists, the computer will randomly and fairly select one decision list for payment, and then select one row from that list.**

If for that row, you chose option A, then option A will be implemented. If you chose option B, then option B will be implemented. Every row from every decision list is equally likely to be selected for payment. So you should treat each decision list as if it determines your main task payment.

**Option A and option B will vary across decision lists.**

Option A and option B will involve money being given to you or the children at Children's Hospital. Option B will never involve uncertainty while option A may involve some uncertainty. For each option, you will be informed of the recipient in both options (the children or you) and if there is any uncertainty involved in option A.

Consider an example decision list in the table below. In this example decision list, option A is fixed, and option B varies as follows:

-**Option A** is fixed, but uncertain, you receive \$10 with 75% probability, and \$0 otherwise.

-**Option B** is that you receive some dollar amount. As you proceed down the list, the amount increases from \$0 to \$10.

**Your task** is to decide the smallest amount that you would need to give up your chance to receive \$10 with 75% probability. In other words, you will indicate the point at which you would be willing to give up option A for option B.

Option A	Option B
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$0
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$1
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$2
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$3
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$4
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$5
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$6
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$7
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$8
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$9
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$10

Imagine for a moment the smallest amount that you would accept to give up your chance to receive \$10 with 75% probability (to aid your decisions, we have provided a calculator located on the top right corner of your decision screens). Suppose your answer is \$6, this choice will be indicated as shown in the picture below:

Option A	Option B
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$0
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$1
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$2
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$3
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$4
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$5
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$6
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$7
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$8
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$9
• You get \$10 with 75% probability; and \$0 otherwise	• You get \$10

	Option A	Option B
	• You get \$10 with 75% probability; and \$0 otherwise	• You get \$0
	• You get \$10 with 75% probability; and \$0 otherwise	• You get \$1
→	• You get \$10 with 75% probability; and \$0 otherwise	• You get \$2
	• You get \$10 with 75% probability; and \$0 otherwise	• You get \$3
	• You get \$10 with 75% probability; and \$0 otherwise	• You get \$4
	• You get \$10 with 75% probability; and \$0 otherwise	• You get \$5
	• You get \$10 with 75% probability; and \$0 otherwise	• You get \$6
→	• You get \$10 with 75% probability; and \$0 otherwise	• You get \$7
	• You get \$10 with 75% probability; and \$0 otherwise	• You get \$8
	• You get \$10 with 75% probability; and \$0 otherwise	• You get \$9
	• You get \$10 with 75% probability; and \$0 otherwise	• You get \$10

**Further, suppose that this example decision list was randomly selected for payment. Then:**

-If the third row was randomly selected (indicated with the first arrow above), then option A will be implemented. The computer will randomly and fairly choose a number from 1 to 100. If the chosen number is between 1 and 75 (inclusive) you would receive \$10. If the number is between 76 and 100 (inclusive) you would receive \$0.

-If the eighth row is randomly selected (indicated with the second arrow above), then option B will be implemented, and you would instead receive \$7.

**The above explains how you make choices in ONE decision list. However, in this study, you will be given several decision lists and you must make a choice for each one.**

Each list appears on a separate page. Lists are grouped into 5 blocks, where each block involves different types of decisions (i.e., with respect to whether option A and/or option B involve money being given to the children or to you, and whether option A involves uncertainty).

We will randomly and fairly select one row from one decision list for payment. If that results in a payment to you, you will be paid the relevant amount in cash directly after the study using your payment number. This payment number does not correspond to your seat number and cannot be linked to your decisions or your computer terminal. If the selected decision results in a payment to charity, we will donate the money to the children at the Children's Hospital on your behalf. At the end of the experiment, an assistant will submit a request to University of Pittsburgh for a check to be made out to the Children's Hospital corresponding to the funds donated in your session. After we receive this check from the University, it will be mailed to the Children's Hospital of Pittsburgh. The receipt from this donation will be posted outside 4930A Posvar Hall.

Donating to children at Children's Hospital helps support their most urgent needs– the needs that insurance does not cover. Donations will help improve the quality of life for families struggling with childhood illness. Contributions made today will specifically go toward sustaining the 13 playrooms available to patients at the Children's Hospital. These medical-free zones help provide children a place to escape from talk of their tests and treatments, and allow them to engage in fun, therapeutic activities. Playrooms are funded solely through donations.

If you have any questions about the procedures, please raise your hand now and one of us will come to your seat to answer your questions.

## SCREENSHOTS FROM THE DI TELLA ET AL. REPLICATION

The following are screenshots for Allocators

**Participant Number: 2**

**Role Assignment and Instructions**

Thank you for participating in our study. This is a study about decision making. The other people in this room are also participating in the study. You must not talk to them or communicate with them in any way. If you have a question, please raise your hand and one of us will come to where you are sitting to answer your question in private. Please refrain from asking questions out loud or communicating with other participants.

In this study, you will be randomly assigned to one of two roles: **Allocator** or **Seller**. You will receive your role assignment on your computer following this screen. You will maintain this role throughout the study. You will then be paired with another participant in this session assigned to the other role. Your decisions will affect your payment and the payment of the other person you are paired with. Specific details about how your decisions will affect your earnings will be provided as you move along in the study. Your minimum possible earnings for completing the study are \$6.

You will remain anonymous in the study. Only an ID number will identify your decisions, and any research data collected during the course of the study will only identify your decisions by that number.

Participant Number: 2

## Role Assignment and Instructions

Your first task will be to count the number of **zeroes** (0s) in a table of 0s and 1s. You must answer five of these tasks accurately to proceed in the study. If you give an incorrect answer, you will be presented with a new task. You will earn two tokens per correct answer. Therefore you earn a total of 10 tokens from completing the tasks.

We have placed an example picture of the counting zeroes task below. You do not need to count the zeroes in this example - it is for illustrative purposes only.

010011
011011
001110
010101
000011
010010

How many zeros are in the table?

1

OK

You counted 0 tables correctly.  
You have currently earned 0 tokens.

Participant Number: 2

### Role Assignment and Instructions

After you receive your 10 tokens on account of having completed the five tasks, you will be paired with another participant in the session assigned to the role of **Seller**. Your partner **Seller** also has 10 tokens. Between the two of you, you have 20 tokens. In other words, you have to decide how many tokens out of your 10 tokens you are going to keep or give to your partner **Seller**, and how many of your partner **Seller's** tokens to you are going to take or leave.

There are two types of **Allocators**: those who can move up to 8 of each participant's tokens, and those who can move up to 2 of each participant's tokens. You are to move up to **8** tokens, which means that you can keep any number of tokens between **2 and 18** of the 20 tokens. Your partner **Seller** will keep the remaining tokens. In the table below, your options include any row without asterisks, and any row with one (\*) asterisk.

#### Allocator Tokens

#### Seller Tokens

Tokens: 10

Tokens: 10

Previous Page

Participant Number: 2

### Role Assignment and Instructions

At the same time you are making your decision, your partner **Seller** is deciding to set the price at which each of the 20 tokens will be sold. Your partner **Seller** chooses between two options:

**Option A:** Each token will be worth \$1.50.

**Option B:** Each token will be worth \$0.50, and the Seller will receive a bonus of \$5.

Your partner **Seller** will not be able to know how you distributed the tokens until after they have set the price of the tokens. At the same time you as the **Allocator** will not know your partner **Seller's** choice between **Option A** or **Option B** until after you have distributed the tokens. Remember that your decisions are anonymous: neither participant knows which of the other participants in the session they are paired with.

[Next Page](#)

[Previous Page](#)

**Participant Number: 2**

### **Role Assignment and Instructions**

Before you make your decision, let us take a look at an example:

If the **Seller** chooses **Option B**, \$0.50 per token, and the **Allocator** chooses to keep 12 tokens, the **Allocator** will collect:

$$\$0.50 \times 12 = \$6$$

And the **Seller** will collect:

$$(\$0.50 \times 8) + \$5 = \$9$$

On the other hand, if the **Seller** chooses **Option A**, \$1.50 per token, and the **Allocator** chooses to keep 10 tokens, the **Allocator** will collect:

$$\$1.50 \times 10 = \$15$$

And the **Seller** will collect:

$$\$1.50 \times 10 = \$15$$

Please note that your partner **Seller** knows that there are two types of **Allocators**: those who can move up to 8 of each participant's tokens, and those who can move up to 2 of each participant's tokens. However, your partner **Seller** DOES NOT know which type of **Allocator** you are.

### Comprehension Questions

Q1. Suppose that the **Allocator** decides to keep 10 tokens and leave 10 tokens to the **Seller**. If the **Seller** chooses **Option B** (\$0.50 per token), how much will each collect (in dollars)?

Allocator:

Seller:

Your answer is correct! At a price of \$0.50 per token, the **Seller** will get \$5 from the value of their tokens plus \$5 for choosing **Option B**. The total payment to the **Seller** will be \$10 ( $0.50 \times 10 + \$5$ ). The **Allocator** will get \$5 ( $0.50 \times 10$ ) from the value of their tokens.

### **Questions**

Over the next few pages, you will be asked a series of questions. The answer to one of these questions will be randomly selected for payment. Each question has an equally likely chance of being picked. Information about how your answers may affect your payment will be provided alongside each question.

As explained to you in the instructions, your partner **Seller** selects the value of each token from two options:

**Option A:** \$1.50 per token

**Option B:** \$0.50 per token with a \$5 bonus payment for the **Seller**

What option do you think your partner **Seller** selected? If this question is randomly selected for payment, and if your answer coincides with the actual choice made by your partner **Seller**, you will receive a bonus payment of \$5.

Please click 'Continue' to confirm your belief of **Option B: \$0.50 per token**

Click 'Back' if you would like to revise your decision.

**Participant Number: 2**

### **Questions**

In a few words, please explain why you think your partner Seller selected the option you indicated in the previous question.

Continue

**Participant Number: 2**

## **Questions**

In this session, **1** individuals were assigned the role of **Seller** (including your assigned partner **Seller**). Each of these **Sellers** faced the same choice between **Option A** and **Option B**.

Out of these **1 Seller**, how many do you think selected **Option B** (\$0.50 per token with \$5 bonus payment to **Seller** only)? If this question is randomly selected for payment, your compensation for this question will be as follows:

\$8 if you choose the exact number of **Sellers** who actually chose **Option B** ;

\$6 if your choice is 1 more OR less than the actual number of **Sellers** who chose **Option B** ;

Please choose the number of **Sellers** that you think selected **Option B**.

**Participant Number: 1**

### **Role Assignment and Instructions**

After you receive your 10 tokens on account of having completed the five tasks, you will be paired with another participant in the session assigned to the role of **Allocator**. Your partner **Allocator** also has 10 tokens. Between the two of you, you have 20 tokens. Your partner **Allocator** is going to distribute the 20 tokens between the two of you. In other words, your partner **Allocator** is going to decide how many of your 10 tokens to take or leave, and how many of your partner **Allocator's** tokens to keep or give to you. At the same time as the **Seller**, you need to select the value at which you want to sell the 20 tokens.

**Option A:** Each token will be worth \$1.50.

**Option B:** Each token will be worth \$0.50, and as compensation you will receive \$5 just for yourself.

Your partner **Allocator** will not be able to know if you chose **Option A** or **Option B** until after the tokens have been distributed. At the same time you as the **Seller** will not know how the **Allocator** distributed the tokens until after having chosen either **Option A** or **Option B**. Remember that your decisions are anonymous: neither participant knows which of the other participants in the session they are paired with.

Next Page

Previous Page

**Participant Number: 1**

### **Role Assignment and Instructions**

Before you make your decision, let us take a look at an example:

If the **Seller** chooses **Option B**, \$0.50 per token, and the **Allocator** chooses to keep 12 tokens, the **Allocator** will collect:

$$\$0.50 \times 12 = \$6$$

And the **Seller** will collect:

$$(\$0.50 \times 8) + \$5 = \$9$$

On the other hand, if the **Seller** chooses **Option A**, \$1.50 per token, and the **Allocator** chooses to keep 10 tokens, the **Allocator** will collect:

$$\$1.50 \times 10 = \$15$$

And the **Seller** will collect:

$$\$1.50 \times 10 = \$15$$

Finally, you need to know that there are two types of **Allocators**: those who can move up to 8 of each participant's tokens, and those who can move up to 2 of each participant's tokens. It is equally likely that you are paired with either **Allocator** type. What you do not know is which type of **Allocator** you are paired with.

The following are the screenshots for the bonus round for both allocators and sellers:

Participant Number: 2

Bonus Round

In this stage, you will be asked to choose between two options, X and Y, which will result in different payoffs. You will make three of these decisions. Some of the payoff resulting from the option you choose will be yours to keep, and some will be donated on your behalf to UPMC Children's Hospital. There are two possible states, **state 1** and **state 2**, and the payoffs associated with each option depend on this state.

In some cases, you will be aware of this state, and will know the amount you will keep and the amount that will be donated on your behalf to UPMC Children's Hospital with certainty. In other cases, you will not know the state initially, but you will be given the option of revealing it before making your choice. Payoffs that depend on the state will be denoted by "?" (a question mark) when you do not know the state. The state is determined by a coin flip, so there is an even chance of each state occurring.

Press 'Next Page' below to see the remaining instructions.

Next Page

Participant Number: 2

Bonus Round

**For this stage only, two people in this session will be selected at random by the computer to be paid and to have a donation made to UPMC Children's Hospital on their behalf.** Each individual in the session has an equal chance of being selected, regardless of their choices.

If you are randomly selected, the pay you will receive from this stage will be from **one** of the decisions you make, with each decision having a 1/3 chance of being chosen. If you are not randomly selected, your decisions in this stage will not be implemented. You will be informed on your computer screen at the end of the study if you are randomly selected.

Finally, the following is the reference handout distributed to all participants after they have read the instructions on the computer screen:

## General Instructions

---

### *Allocator Decision*

The **Allocator** must decide how to distribute the 20 tokens between themselves and their partner Seller, starting from an initial allocation of 10 tokens for each individual. Remember that there are two types of Allocators: ones who can move up to two tokens between themselves and their partner Seller, and ones who can move up to eight tokens. The table below lists all possible distributions of tokens:

Allocation Decision	
Allocator Tokens	Seller Tokens
20**	0**
19**	1**
18*	2*
17*	3*
16*	4*
15*	5*
14*	6*
13*	7*
12	8
11	9
10	10
9	11
8	12
7*	13*
6*	14*
5*	15*
4*	16*
3*	17*
2*	18*
1**	19**
0**	20**

\* Allocation is only possible if the Allocator is able to move up to eight tokens.

\*\* Allocation is not possible regardless of which Allocator type is randomly assigned.

---

### *Seller Decision*

The **Seller** must set the dollar amount at which the tokens will be valued. They can choose between two options:

**Option A:** Each token is worth **\$1.50**

**Option B:** Each token is worth **\$0.50**, and the Seller will receive a bonus of **\$5.00**

Both Allocators and Sellers will make their decisions without knowing what the other decided. Both decisions will affect the payment that each player receives.

Please see the next page to view a table of payoff possibilities

A summary of all of the possible decisions and corresponding payoffs under both token values are listed in the table below:

Allocation Decision		Option A: Seller chooses \$1.50		Option B: Seller chooses \$0.50 + \$5.00	
Allocator Tokens	Seller Tokens	Allocator Payoff	Seller Payoff	Allocator Payoff	Seller Payoff
20**	0**	\$30.00**	\$0.00**	\$10.00**	\$5.00**
19**	1**	\$28.50**	\$1.50**	\$9.50**	\$5.50**
18*	2*	\$27.00*	\$3.00*	\$9.00*	\$6.00*
17*	3*	\$25.50*	\$4.50*	\$8.50*	\$6.50*
16*	4*	\$24.00*	\$6.00*	\$8.00*	\$7.00*
15*	5*	\$22.50*	\$7.50*	\$7.50*	\$7.50*
14*	6*	\$21.00*	\$9.00*	\$7.00*	\$8.00*
13*	7*	\$19.50*	\$10.50*	\$6.50*	\$8.50*
12	8	\$18.00	\$12.00	\$6.00	\$9.00
11	9	\$16.50	\$13.50	\$5.50	\$9.50
10	10	\$15.00	\$15.00	\$5.00	\$10.00
9	11	\$13.50	\$16.50	\$4.50	\$10.50
8	12	\$12.00	\$18.00	\$4.00	\$11.00
7*	13*	\$10.50*	\$19.50*	\$3.50*	\$11.50*
6*	14*	\$9.00*	\$21.00*	\$3.00*	\$12.00*
5*	15*	\$7.50*	\$22.50*	\$2.50*	\$12.50*
4*	16*	\$6.00*	\$24.00*	\$2.00*	\$13.00*
3*	17*	\$4.50*	\$25.50*	\$1.50*	\$13.50*
2*	18*	\$3.00*	\$27.00*	\$1.00*	\$14.00*
1**	19**	\$1.50**	\$28.50**	\$0.50**	\$14.50**
0**	20**	\$0.00**	\$30.00**	\$0.00**	\$15.00**
